Is this initiative either led the public sector or the public sector is integrally involved? (1191124)

Type: (L/list-radio)

Yes

AO01

Are you a public sector employee involved with the initiative that you are submitting? (1191125)

Type: (L/list-radio)

No

AO02

Do you know the name and/or contact information for a public employee involved with the initiative?* (1191126)

Type: (L/list-radio)

No

Tools and methods to help AI actors

You are about to submit a new hand-on tool or method to help AI actors implement AI.

First, we’re going to ask you several questions about this tool. The OECD.AI team and users very much look forward to finding out about your efforts pertaining to AI.

(1191182)

IfThenWhy Logic RFC (Independent Protocol)

Name of the initiative in English (1174178)

Type: (S/text-short)

IfThenWhy Logic RFC (Independent Protocol)

Excerpt (1191190)

Type: (T/text-long)

A protocol-based framework for defining deterministic agentic intent through the IfThenWhy mandate. It uses machine-readable JSON files to anchor AI actions in a human-defined source of truth (Logical Data Design). It provides a deterministic audit trail for specific data points, ensuring that if there is no business "Why," the data "Then" does not exist.

Name in original language (1174179)

Type: (S/text-short)

Detailed description (1191191)

Type: (T/text-long)

The IfThenWhy Logic RFC Framework is a protocol built on one principle: "If there is no Why, the Then shouldn't exist." It addresses the "Calculation Gap" by providing AI agents with a set of seven machine-readable JSON files that serve as a deterministic engine for logic and math.

The JSON-based Architecture:

MAN (Metric Manifest): Identity and ownership.

SEM (Semantic Layer): Natural language intent.

BRG (Bridge File): Business triggers to data actions.

LDD (Logical Data Design): Authoritative math and validation logic.

ERD (Logical ERD): Conceptual entity relationships.

DIC (Data Dictionary): Physical source-to-target mapping.

LUT (Lookup Tables): Centralized reference data and categorical labels.

Current Utility:
AI agents can leverage this framework right now to ground specific, mapped metrics. When an agent is tasked with a calculation, it references the LDD for the math and the SEM for the intent. This provides deterministic logic for that specific data point.
